

Master Plan

Master Dashboard - Live Page Builder CRM - Quotations & Invoices - Go-Live

Full-stack implementation plan based on the completed deep audit,
the approved design mockup and the five locked decisions.

87-page website - No-code block builder - Lead-gen CRM with live chat & WhatsApp - Server-PDF
quotation pipeline - Vercel hosting.

Status	FOR APPROVAL - development starts after sign-off
Version	1.0 - 28 September 2026
Scope	Phases 0-6 - 13 weeks
Hosting	Vercel (site + admin + API) - Hostinger = domain only
Based on	AUDIT-REPORT-2026-09-28.md + design mockup + admin screenshots

Woodex -> Hostinger Deploy Guide (package v2)

Who this is for: you (no coding needed). Follow in order. Every exact value you must type is in code font.
Golden rule: Parts 1-2 run on the **temporary** address first. **Part 3 (DNS) only after I give the written GO.**

What's in the package

File: dist/wf-admin-v2.zip - upload it once, it contains everything:

Inside the zip	What it is
index.html + page folders	the whole website (87 pages, blog, projects, cities)
admin/	your dashboard - page builder, quotations, invoices, CRM, live chat
api/	the engine (33 functions: login, save, publish, chat, email...)
install.php	one-time setup wizard - run once, then it deletes itself
sql/install.sql	creates all 24 database tables
cron/backup.php	nightly backup - triggered by one cron line
content/	your page-builder drafts (auto-saved data)
.htaccess	HTTPS, clean URLs, old-site redirects, security
config/, backups/, sql/	protected folders (not reachable from the web)

You need: your Hostinger panel login, and about 20 minutes.

PART 1 - Upload & Install (temporary address first)

Step 1 - Create the database

1. hPanel -> **Websites** -> **Manage** -> **Databases** -> **Management**.
2. Click **Create Database** (MySQL).
3. Type a name, e.g. woodex - hPanel adds a prefix like u123456_, that's normal.
4. Type a password (save it somewhere safe).
5. Click **Create**. **Copy the full database name, full username, and password** - you'll paste them in Step 4.
(Full = including the u123456_ part.)

Step 2 - Check PHP version

1. hPanel -> **Websites** -> **Manage** -> **Advanced** -> **PHP Configuration**.
2. Pick **PHP 8.2** (or 8.3) -> **Save**.
3. Make sure extension **pdo_mysql** is ticked (it is by default).

Step 3 - Upload the website

1. hPanel -> **Websites** -> **Manage** -> **File Manager**.
2. Open the **public_html** folder.
3. Click **Upload** -> **Upload files** -> choose wf-admin-v2.zip.
4. Back in public_html, select the zip -> **Extract** -> confirm.
5. You must now see index.html, install.php, .htaccess **directly inside public_html**.
 - ? Wrong: public_html/wf-admin-v2/index.html (a folder in between) -> open that folder, Select All -> Cut -> Paste into public_html.
 - ? Right: public_html/index.html.
6. Delete the zip (saves space).

Step 4 - Run the installer

1. In hPanel -> **Websites** -> **Manage**, find the **temporary URL** (also called *Website Details -> Temporary URL*, e.g. xyz789.hstgr.cloud).
2. Open <https://TEMP-URL/install.php> in your browser.
3. Fill the form **exactly**:

Field	What to type
Database host	localhost
Database name	paste the full name from Step 1
Database user	paste the full user from Step 1
Database password	the password from Step 1
Admin username	woodexadmin
Admin password	Wx-0c41a9-c481e4 (and repeat it)
Outgoing email (optional)	leave blank for now - mailbox comes in Step 6
? Delete install.php automatically	leave ticked

4. Click **Install**. You should see: **OK Installation complete**.
5. **On that success screen, copy the backup command it shows you** (looks like `curl -s "https://.../cron/backup.php?key=..."`) - you'll paste it in Step 5.

Step 5 - Nightly backups

1. hPanel -> **Websites -> Manage -> Advanced -> Cron Jobs** (or search "Cron" in the hPanel search bar).
2. Add a job: schedule **Daily at 03:00**.
3. In *Command*, paste the backup command you copied from Step 4. -> **Save**.
4. Click **Run now** once to test it.
5. Check: File Manager -> backups/ should now contain backup-....zip. ?

Step 6 - Mailbox (for quotation & invoice emails)

1. hPanel -> **Websites -> Manage -> Emails -> Create mailbox**.
2. Suggested: info@woodex.com.pk + a password you save. -> **Create**.
3. Because you left SMTP blank at install: File Manager -> public_html/config/config.php -> right-click -> **Edit** (plain text). Find 'mail' and fill two lines:

```
'user' => 'info@woodex.com.pk', // your full mailbox  
'pass' => 'the-mailbox-password',
```

4. Save. (If you'd rather type these into the installer instead, you can skip this edit - same result.)

Step 7 - SSL (padlock icon)

1. hPanel -> **Websites -> Manage -> Security -> SSL**.
2. Select the domain -> **Install** (free Let's Encrypt, auto-renews).
3. Done - the site already forces HTTPS.

Part 1 complete: https://TEMP-URL/ shows the website and https://TEMP-URL/admin/ signs in.

PART 2 - Staging checklist (tick every box BEFORE DNS)

Test everything on the **temporary URL**. Tick only what you actually saw.

- ☐ **Homepage** loads - hero, services, footer, images all look right
- ☐ **3 inner pages** open (e.g. /about/, /services/interior-design/, /contact/) - no "404", no broken layout
- ☐ **Contact form** on /contact/ - submit a test message -> appears in dashboard -> **Enquiries**
- ☐ **Dashboard login** - https://TEMP-URL/admin/ with woodexadmin / Wx-0c41a9-c481e4 -> Dashboard shows (all zeros are normal)
- ☐ **Page builder** - open any page in the builder, change one word, **Publish** -> refresh the live page -> your word is there **instantly**
- ☐ **Chat bubble** - homepage shows the blue ? button (bottom-right) -> type "test" -> in dashboard **Live Chat** the conversation appears -> **reply** -> back on the page your reply shows within 5 seconds
- ☐ **Quotation** - create a quick quotation -> open its preview -> click **Email** -> button turns **Sent OK** (needs Step 6 mailbox)
- ☐ **Backup** - the cron test from Step 5 produced a zip in backups/ (you can also see it in dashboard -> **Backups**)
- ☐ **Sitemap** - https://TEMP-URL/sitemap.xml opens and lists pages
- ☐ **404 page** - open a nonsense address like /sdfg/ -> the styled "page not found" appears
- ☐ **Mobile view** - check homepage + one inner page on your phone
- ☐ **Login security** - type a wrong password twice at /admin/ -> error appears (after 5 tries it pauses briefly - that's the protection working)

Every box ticked -> Part 3 is unlocked (with my GO). If something fails, tell me which box.

PART 3 - DNS cutover *(STOP - start only after my written GO)*

This is the moment woodex.com.pk switches from the old site to this one.

Step 1 - Find your Hostinger IP

hPanel -> **Websites** -> **Manage** -> **Details** -> copy the **IP address** (looks like 185.1XX.XX.XX).

Step 2 - Point the domain

If the domain is managed in Hostinger (Domains -> your domain -> DNS):

1. Add record **A**: Name/Host = @ (or @/blank), Points to = *your IP*, TTL = auto -> Save.
2. Add record **CNAME**: Name = www, Points to = woodex.com.pk -> Save.
3. Remove any *old* A/CNAME records for @ or www pointing elsewhere.

If the DNS lives somewhere else (old host or another registrar): same two records there - @ -> your Hostinger IP (A), www -> woodex.com.pk (CNAME). Easier alternative: switch the domain's **Name Servers** to Hostinger's (hPanel shows them under the domain once added).

Step 3 - Wait & watch propagation

1. Open <https://whatsmydns.net/#A/woodex.com.pk> - click Search - green ticks worldwide = propagated (usually 5-60 min, up to 24 h).
2. Meanwhile the temporary URL keeps working - you lose nothing while waiting.

Step 4 - Verify the live site

1. Open <https://woodex.com.pk/> -> must be the **new** site (title: *Woodex Interior | Design, Fit-Out & Architecture Lahore*), padlock visible.
2. Re-run **five boxes** of Part 2 on the real domain: homepage, one inner page, contact form, admin login, chat bubble.
3. Check an old-site URL redirects instead of 404: e.g. <https://woodex.com.pk/services/> should land on the new services page (old links are 301-mapped automatically).

Step 5 - Google cleanup (same day)

1. [Google Search Console](#) -> property woodex.com.pk -> **Sitemaps** -> submit sitemap.xml.
2. URL Inspection -> woodex.com.pk -> **Request indexing**.
3. The old site had junk/spam URLs indexed - after cutover they return our 404 page; in GSC use URL Inspection -> *Remove* (temporary removal) on a few of them if they still appear.

Step 6 - Email final check

Send yourself a quotation email to the real domain address (info@woodex.com.pk) - arrives in inbox (check Spam once).

PART 4 - After go-live (routine)

When	What
Nightly 03:00	automatic backup runs (keep: last 14 days)
Weekly (1 min)	dashboard -> Backups -> confirm a fresh row exists
When editing site	dashboard -> publish is instant - no FTP, no re-upload
Never	don't share /config/, backups/, sql/ URLs - they're blocked by design

If you ever need a restore: File Manager -> upload the zip into backups/ -> tell me -> we restore together.

Troubleshooting (most likely -> fix)

Symptom	Fix
Database is not configured yet (503)	open /install.php - you skipped Step 4
already installed on install.php	correct - it finished; sign in at /admin/
Installer: Access denied on database	wrong name/user/password - re-copy full prefixed name from hPanel (Step 1)
Installer: Could not write config	config/ folder not writable -> File Manager -> folder -> Permissions -> 755
Dashboard page is blank	hard refresh Ctrl+Shift+R; still blank -> PHP version (Step 2)
Email button says Could not send	mailbox not created yet (Step 6) or config/config.php mail.user/pass empty
No zip after cron	command must start with curl and the key= must match the success screen; domain in URL must be the live one after cutover
Chat bubble missing	hard refresh; confirm assets/js/wx-chat.js exists (Step 3 extract worked)
Old site still shows after DNS	propagation not finished - re-check whatsmysdns; also clear your own cache/VPN

Package built from branch arena/01a0e87c-marketingwoodex - H1-H6 complete (redirects, database, 33-function API, auth headers, backup cron, live chat + email). Deployment itself requires my explicit GO.
